Oregon Geology - Parent of the Soil, Foundation for the Vine

Ray Wells

US Geological Survey, 345 Middlefield Rd. MS 973, Menlo Park, CA, 94025

Project Chief, Pacific Northwest Urban Corridor Geologic Mapping

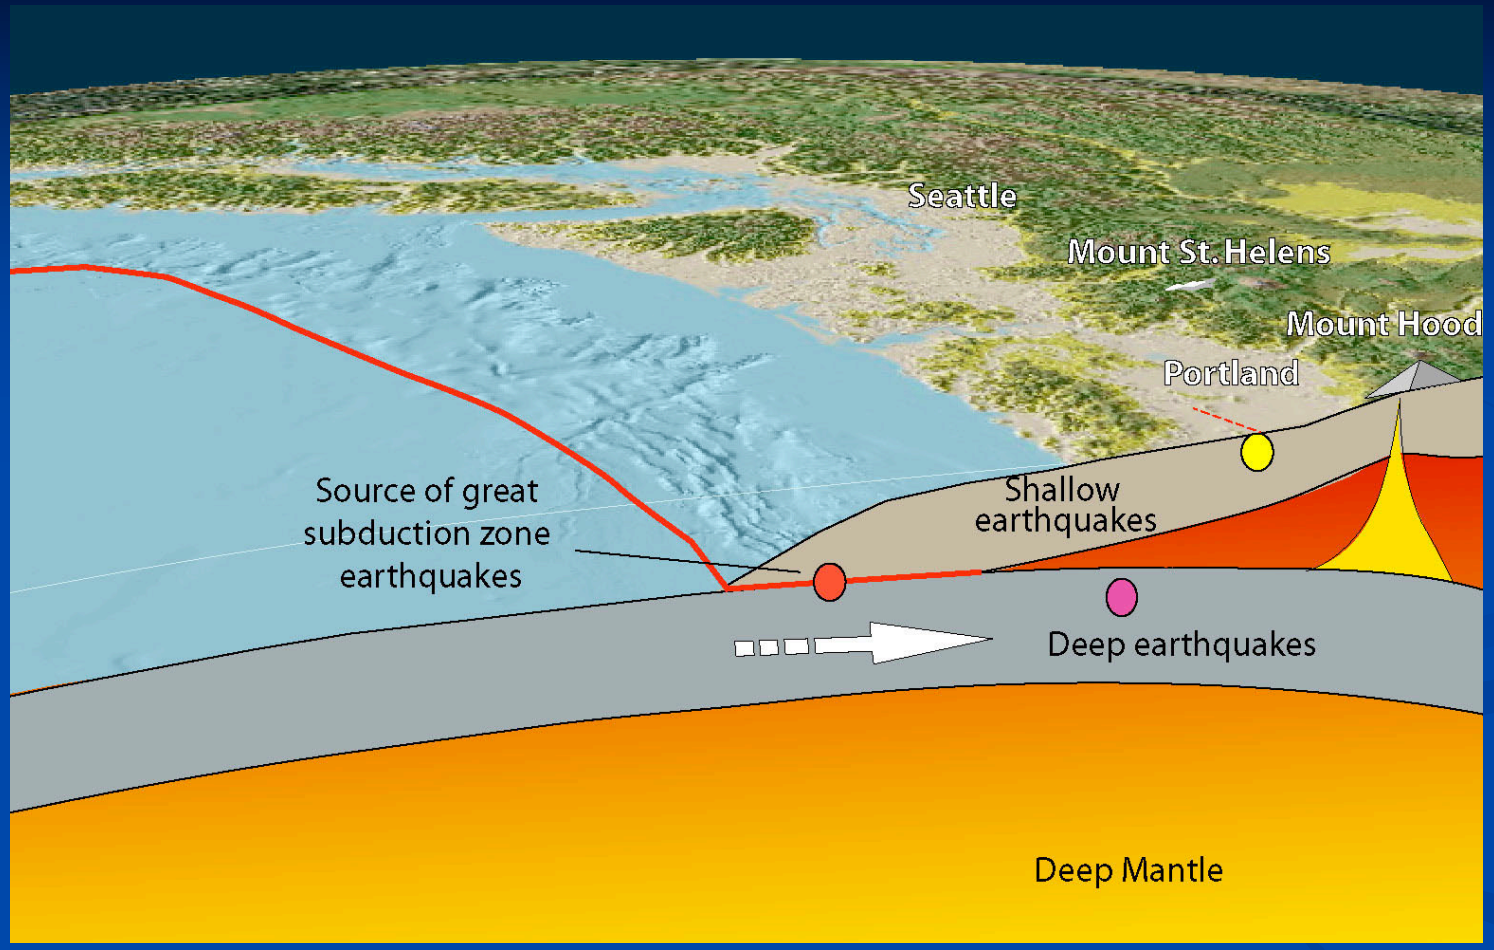
Project Website: http://geology.wr.usgs.gov/wgmt/pacnw

Cooperators - Alan Campbell, Chemeketa Community College, Salem, Oregon

Dave Johnson, Natural Resources Conservation Service, Salem, Oregon

USGS
science for a changing world

Here we are on the leading edge….



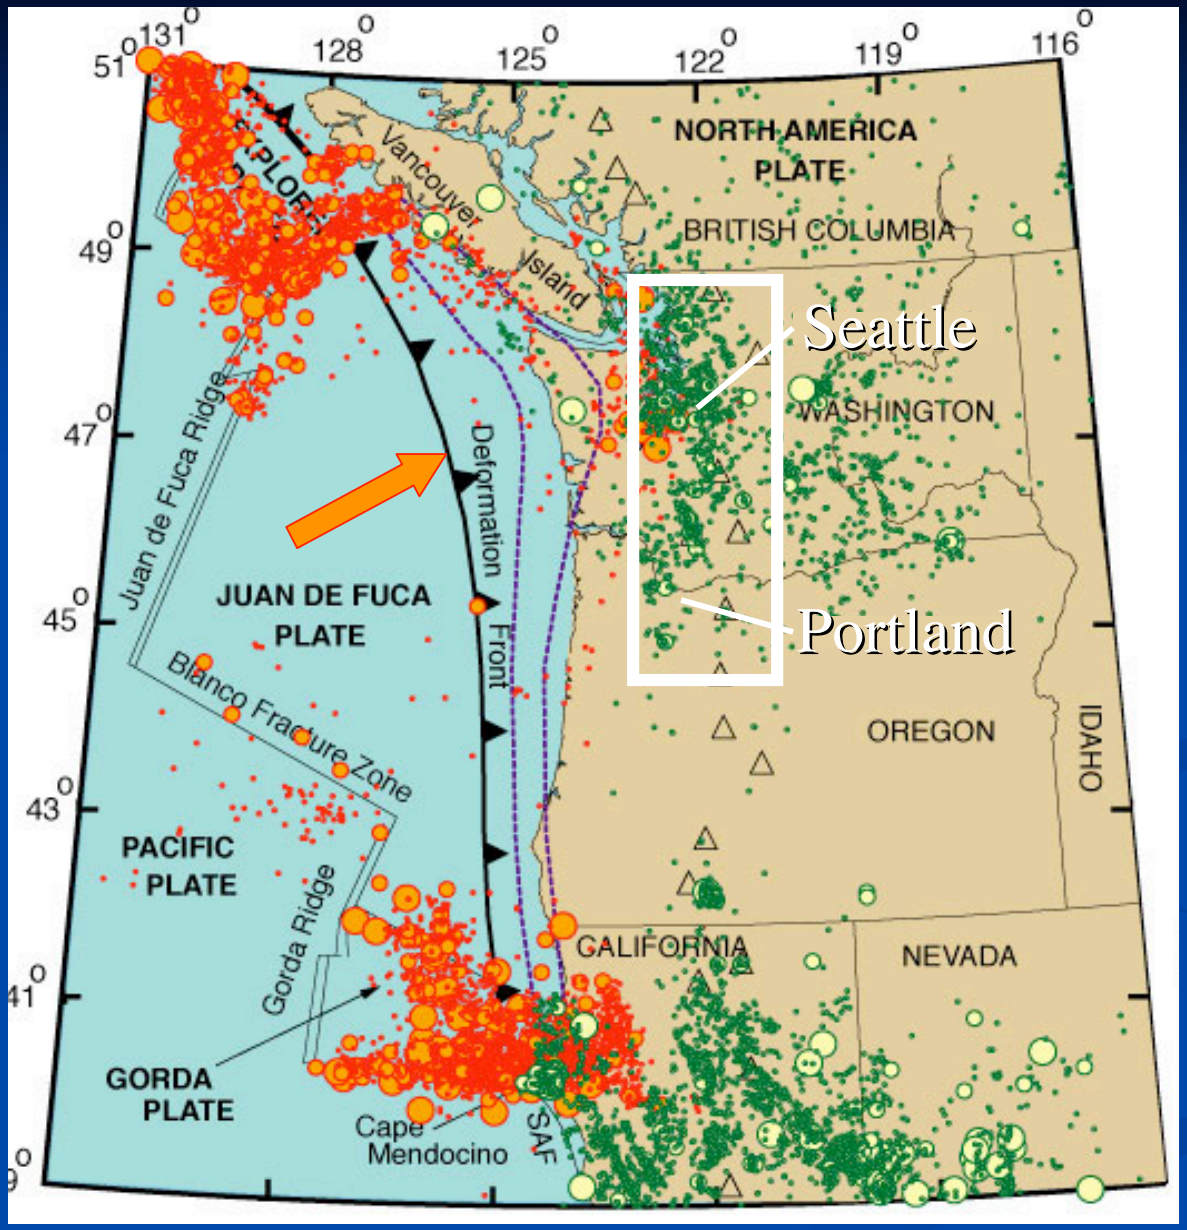
- This is where the Juan de Fuca oceanic plate dives beneath North America and sinks into the earth's deep mantle.
- This zone of convergence is called the Cascadia subduction zone, and it is the source of our rocks, geologic hazards, and landscape.

USGS science for a changing world

Outline of Talk

- Rationale for USGS Geologic Mapping in Oregon
- Geologic map products
- Thumbnail sketch of geologic history
- New mapping in progress - NW Oregon
- Tour of NW Oregon geologic units
- Online sources of information

USGS
science for a changing world



Subduction creates earthquakes and volcanoes

Urban Corridor is seismically active and is an area of intense study by USGS.

Earthquakes:
Green = N. Am plate
Red = J. de Fuca plate
Triangles=major volcanoes

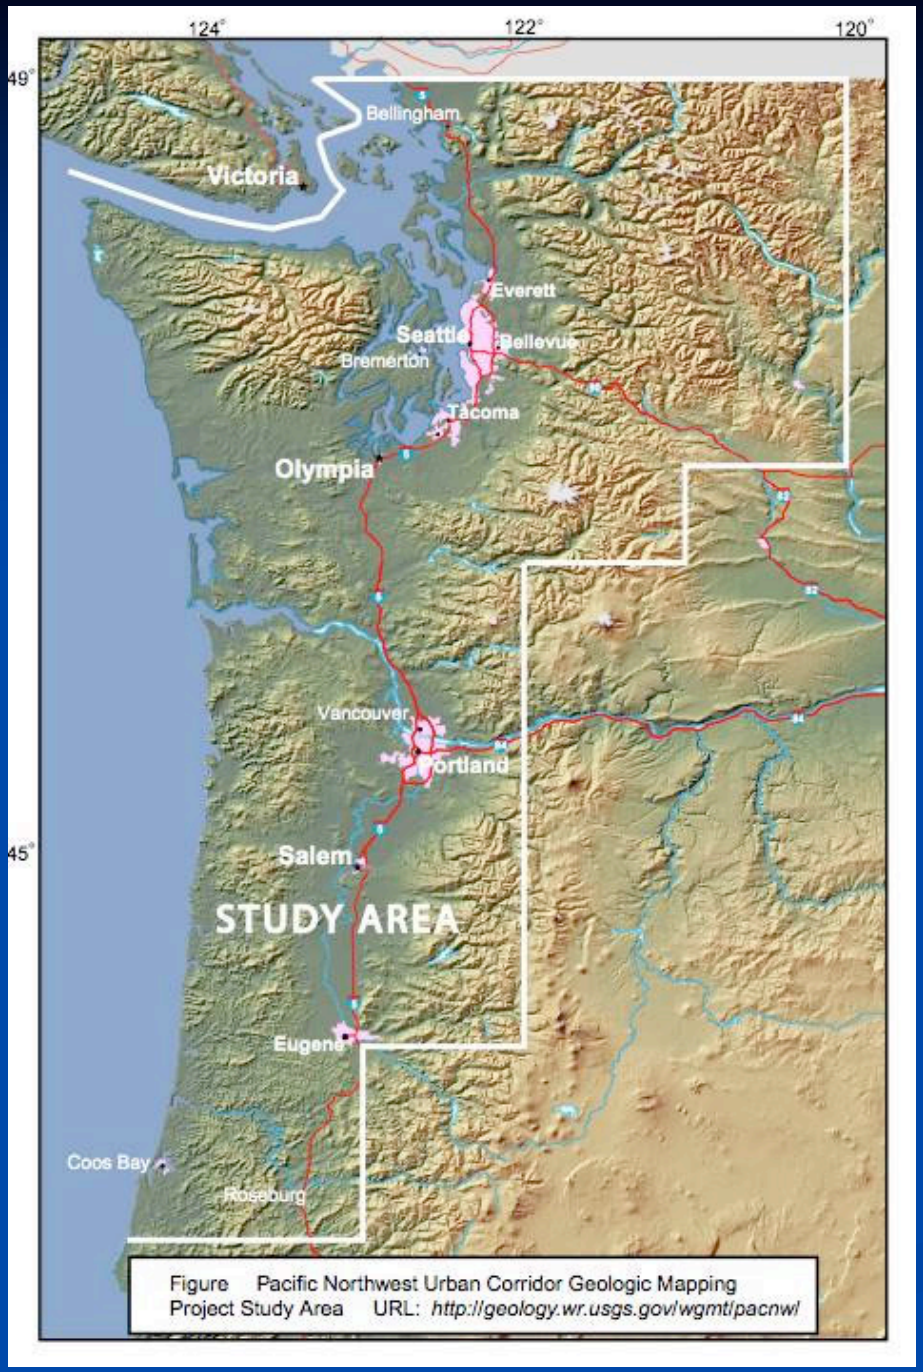
USGS
science for a changing world

Earthquakes are created by motions of crustal blocks

- Small plates and blocks are dragged northward by Pacific Plate
- Blocks collide with one another - a terrane wreck - as they encounter the fixed buttress of Canada.

(from Wang et al., 2003, modified from Wells et al., 1998, Wells and Simpson, 2001; see also Magill et al., 1982; Walcott, 1993; Pezzopane and Weldon, 1993; Argus and Gordon, 1991)

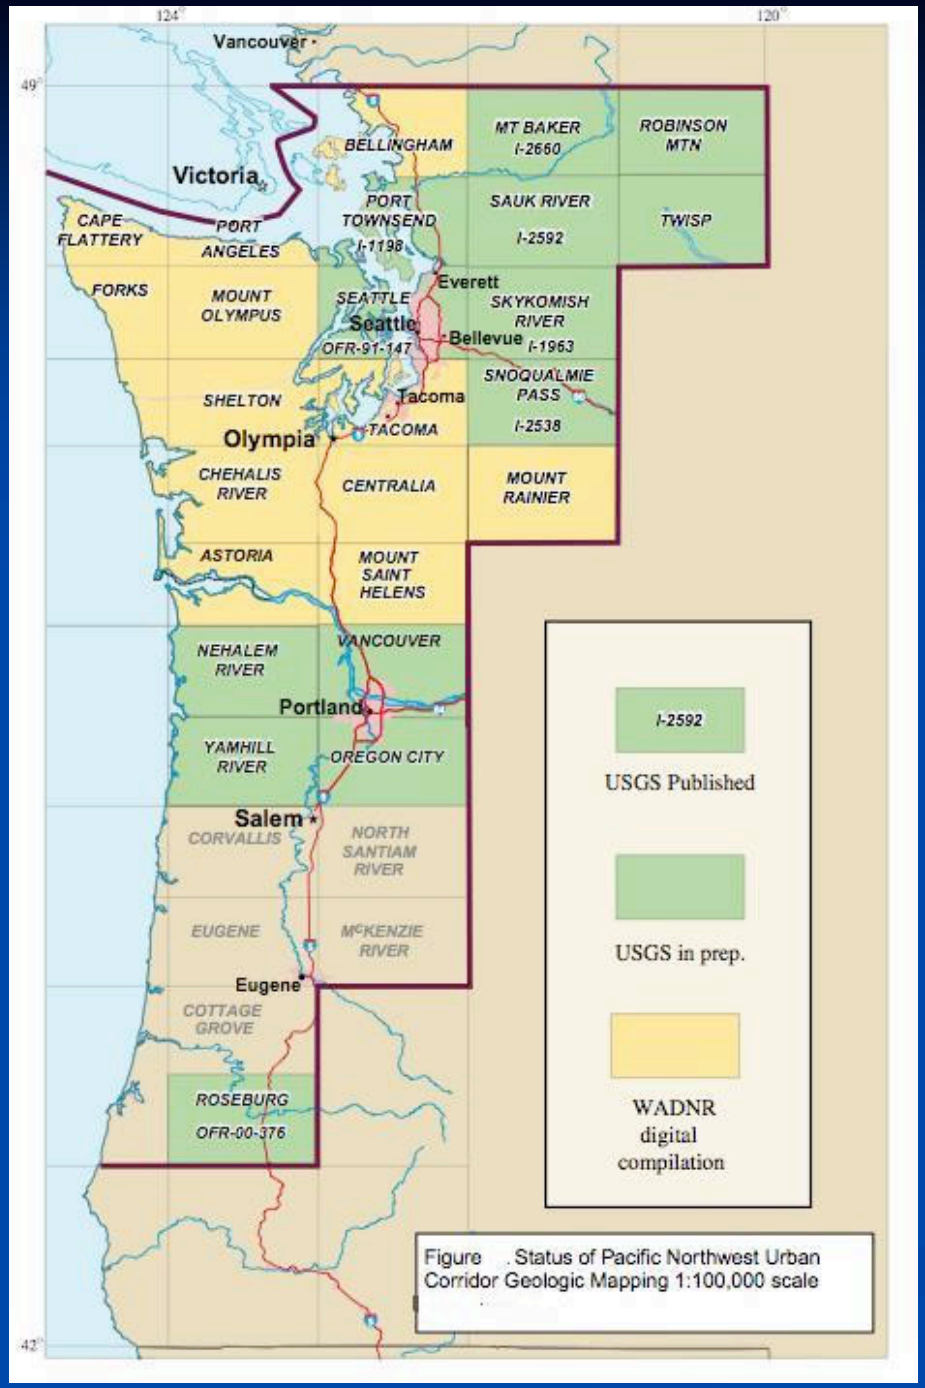
USGS science for a changing world



Geologic mapping is focused on convergent margin and I-5 Urban Corridor.

- Provide information useful for geologic hazard and resource assessments.
  - Distribution, age, and composition of geologic units (rocks and sediments)
  - Geometry and age of geologic structure (folds and faults)

USGS
science for a changing world

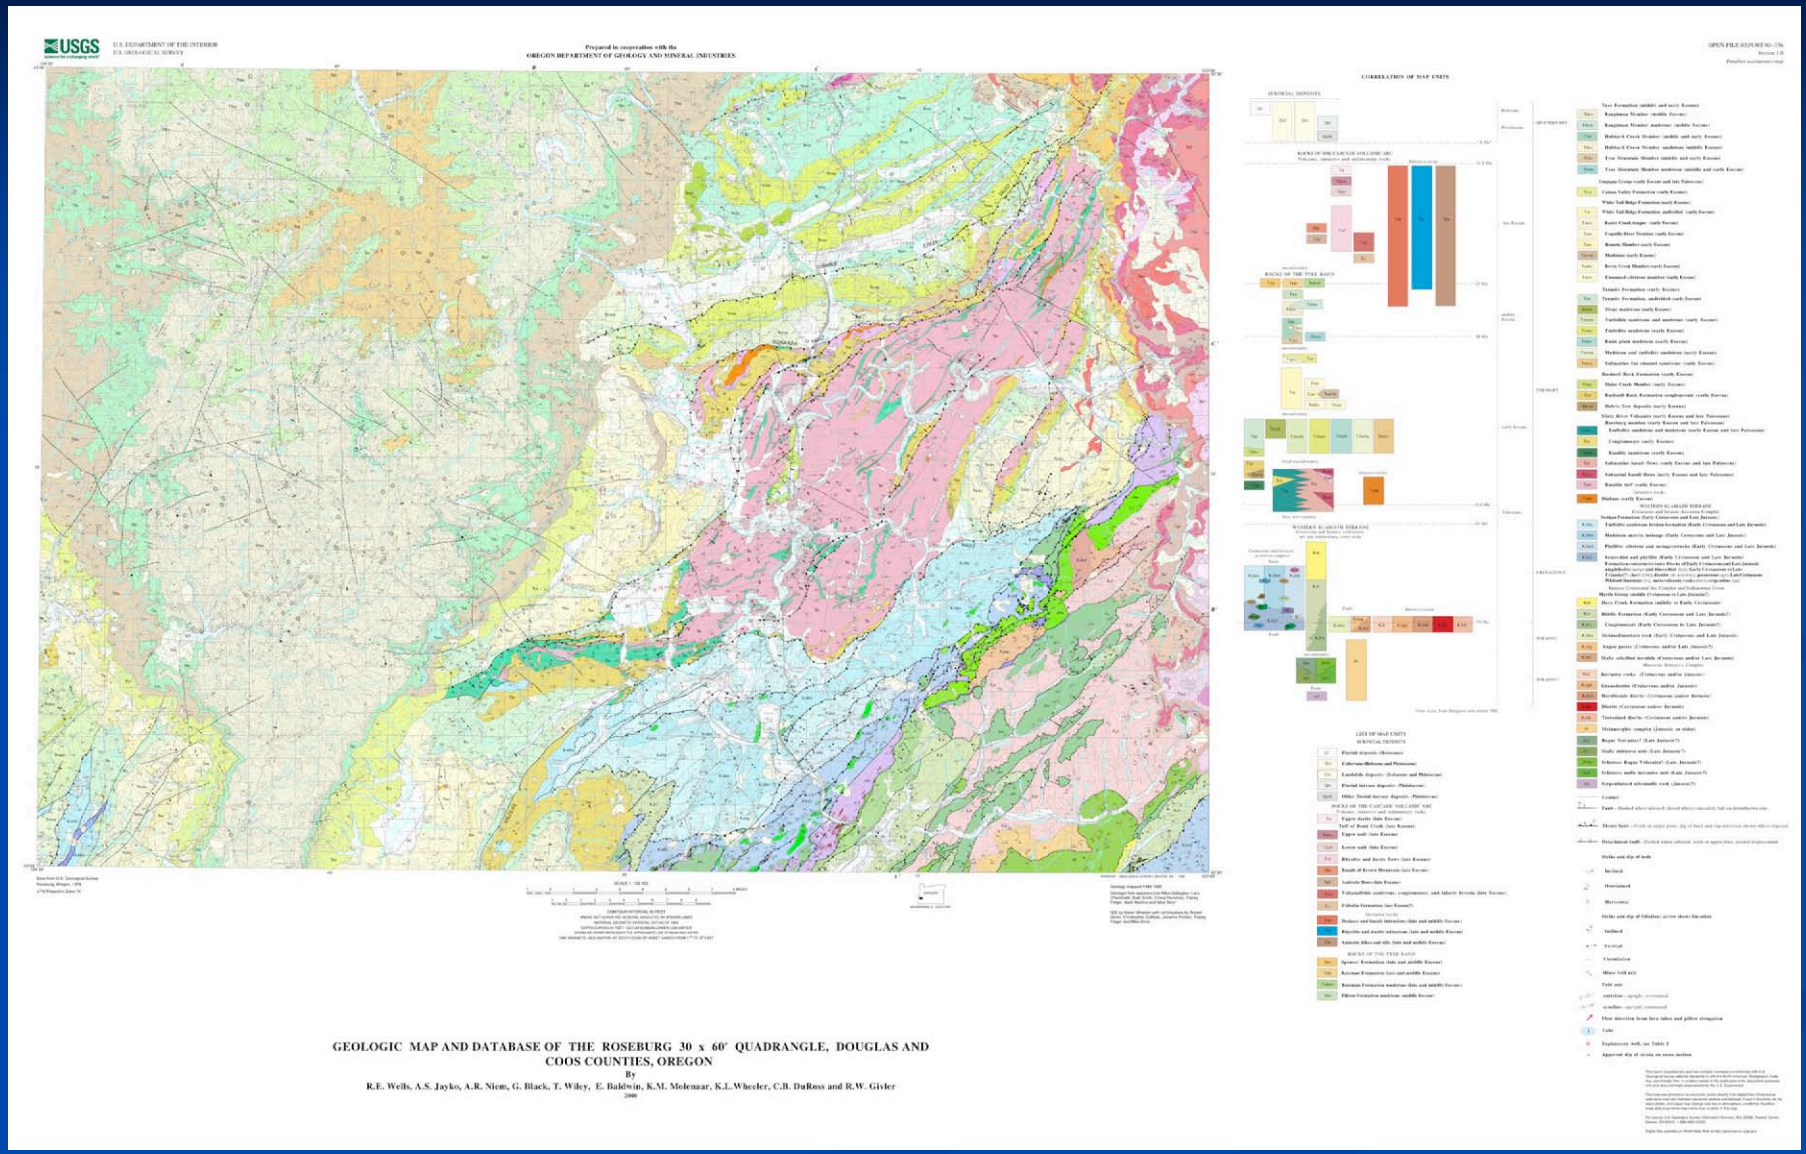


100 K Geologic Mapping

- Scale - 1:100,000 (1 inch on map = 1.6 miles on ground)
- On the web as PDFs and ArcGIS files
- State of Washington has complete digital geologic coverage at this scale (WADNR)
- State of Oregon in progress

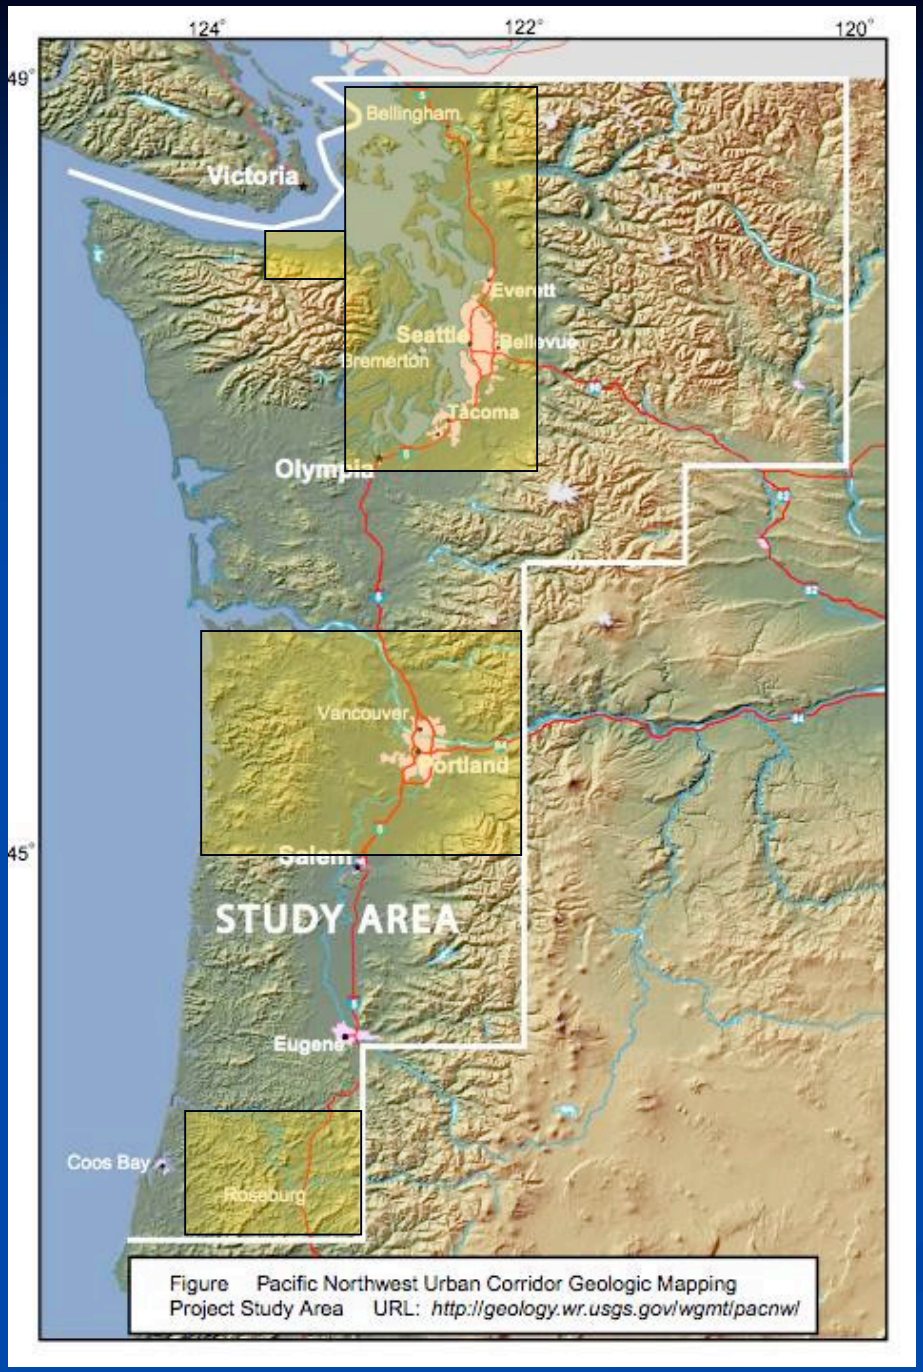
USGS
science for a changing world

Geologic Map of Roseburg 100,000-scale quad



- Online at http://geopubs.wr.usgs.gov/open-file/of00-376/

USGS
science for a changing world

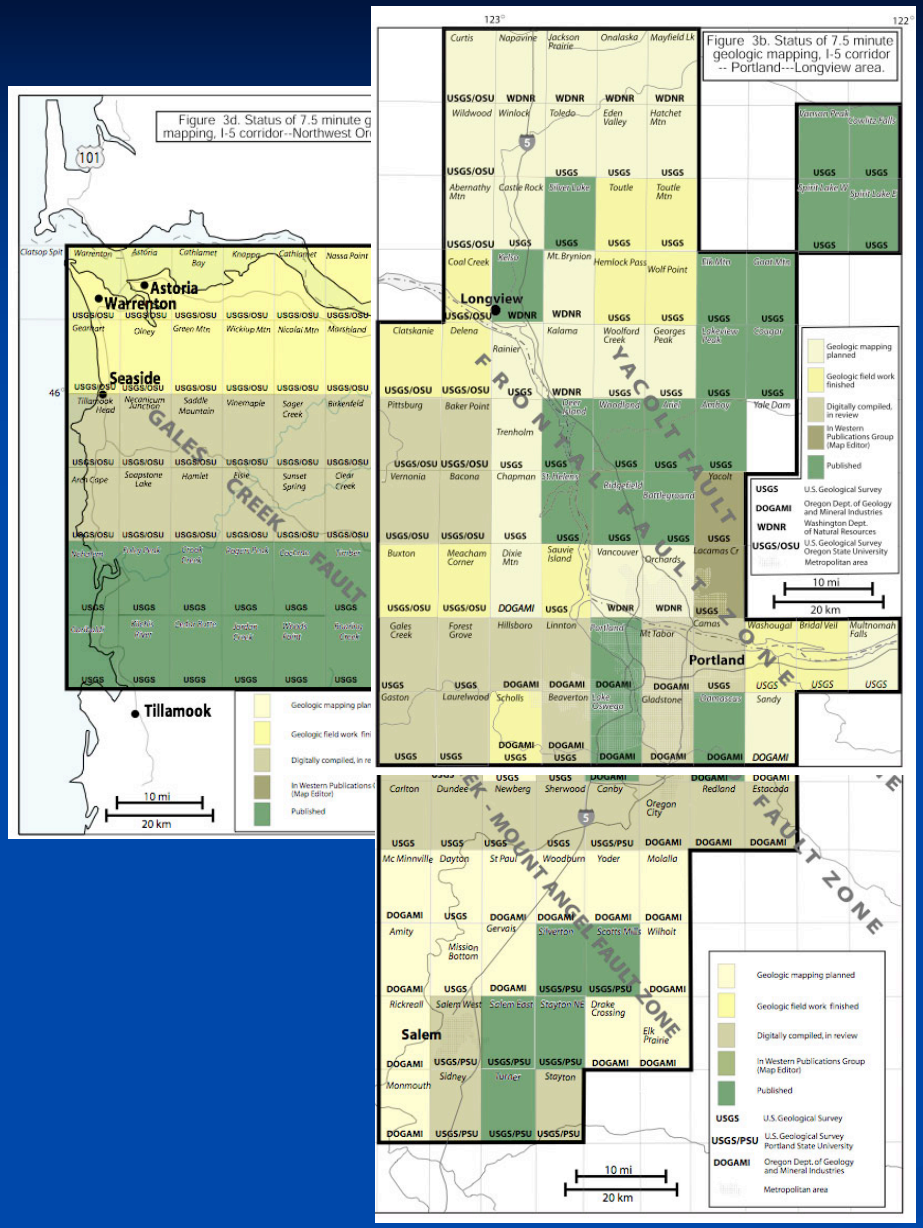


7.5' quad geology

- More detail - Scale is 1:24,000 (1 inch on map = 0.38 miles on ground)
- I-5 Urban Corridor
- On line as PDFs and ArcGIS geodatabases
- OR and WA state surveys (DOGAMI and WADNR) also publish similar maps

USGS
science for a changing world

Status of 7.5' mapping Portland-Salem area



- 139 7.5' quads published or in progress by USGS, DOGAMI, WADGER, OSU, and PSU along I-5 corridor and major fault zones
- All will be digital and available online

USGS science for a changing world

Online 7.5’ map Deer island, OR-WA

USGS science for a changing world

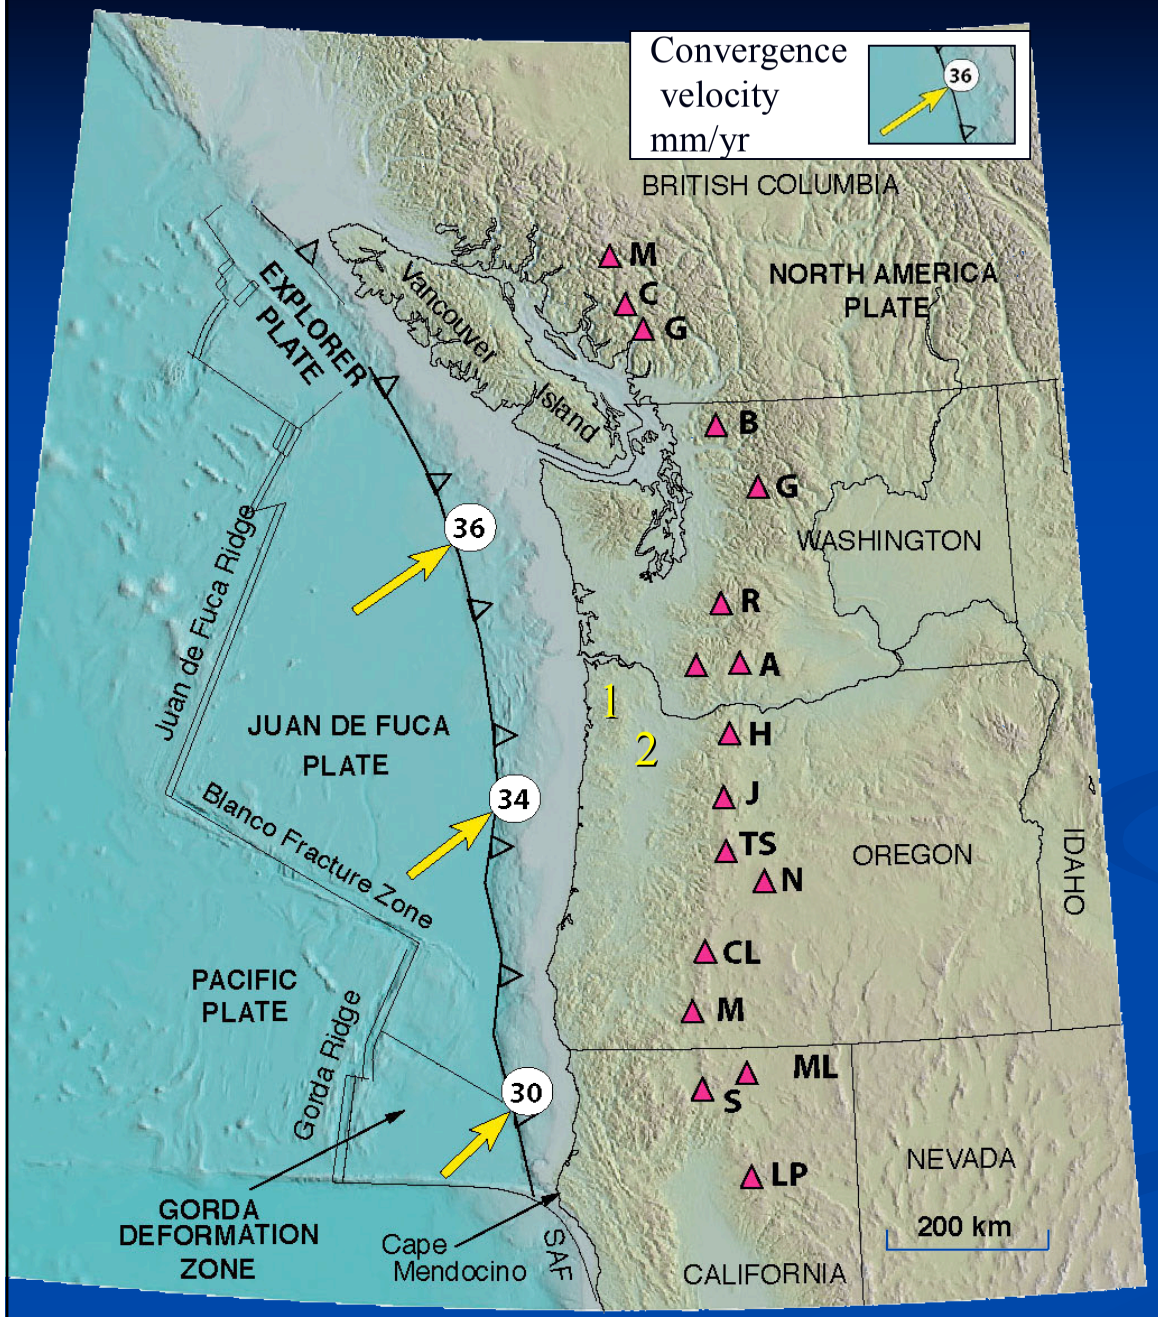
Cascadia Physiography

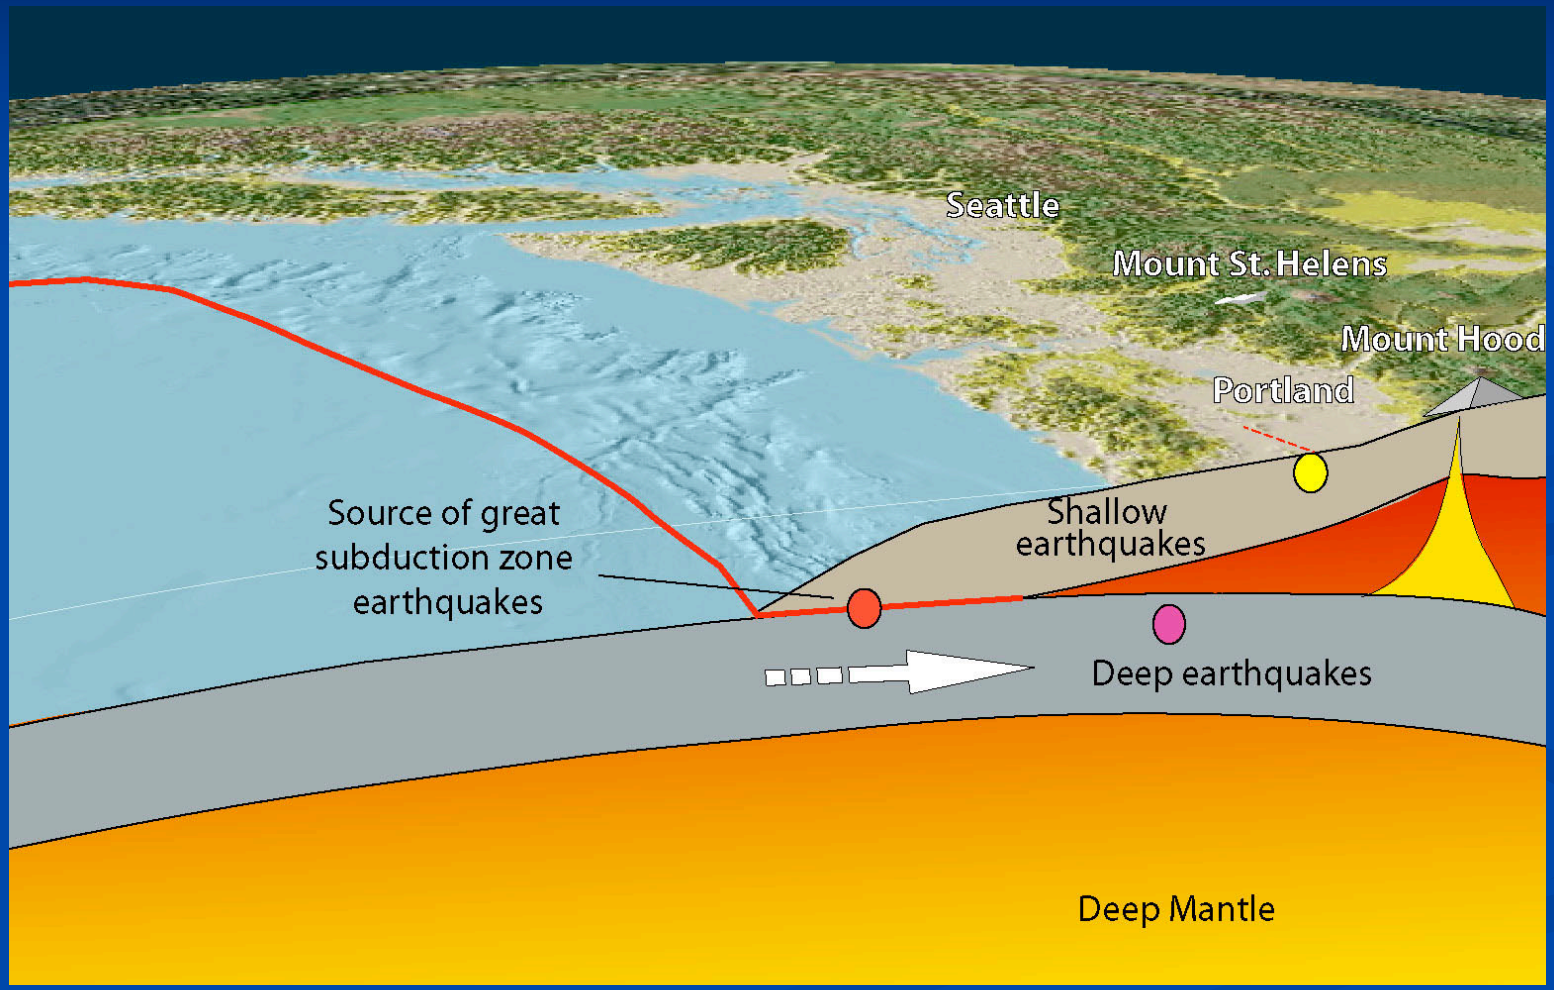


Subduction of Juan de Fuca plate:

- Holds up Coast Range (1)
- Depresses Puget-Willamette trough (2)
- Builds active Cascade volcanic arc (triangles)

USGS science for a changing world

Cascadia's geologic history - A thumbnail sketch of 6 big events:



- For example - Imagine the Hawaiian Islands rafting into the subduction zone…

USGS science for a changing world

1. Collision of ocean island chain with continent

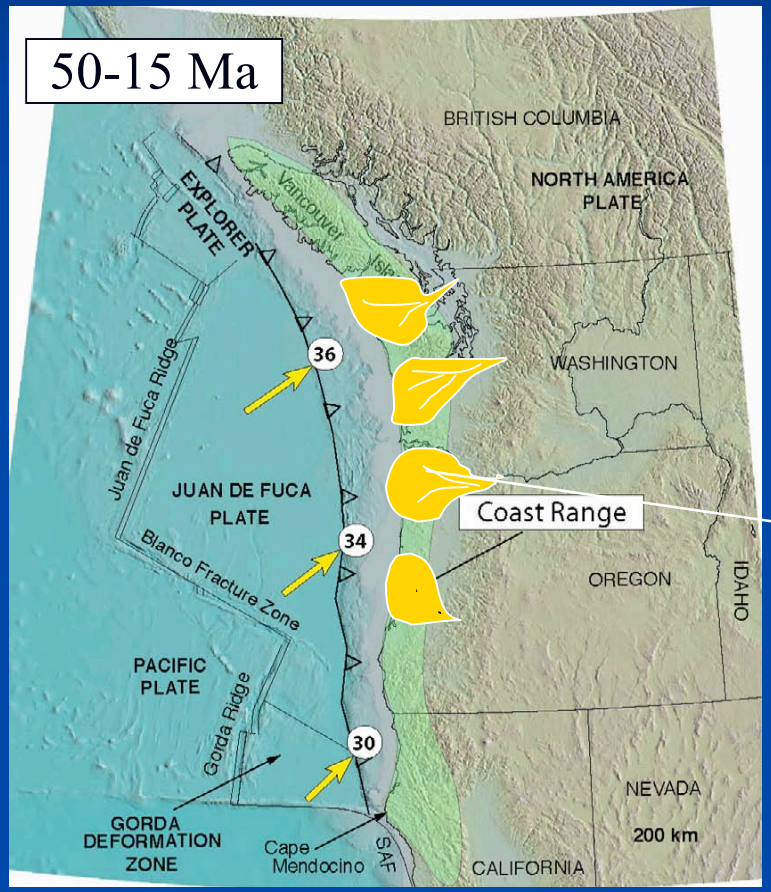
- Island chain - similar to Hawaiian Islands - crashed into N. America and was accreted to the continent at about 50 Ma (million years ago).

52 million-year-old submarine pillow basalt, Trask River

USGS science for a changing world

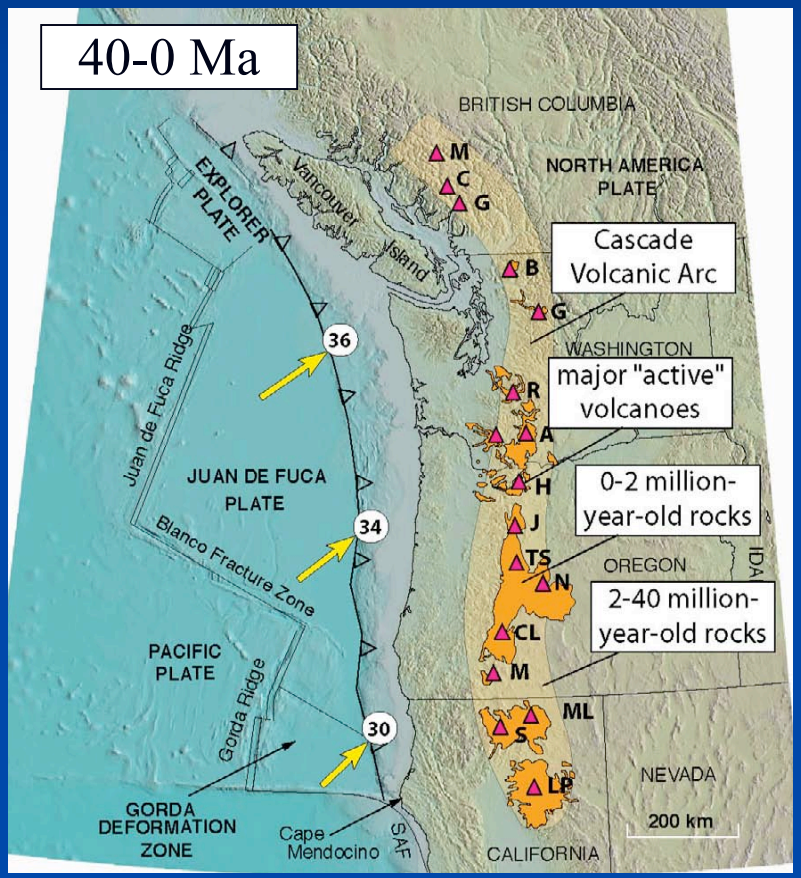
2. Marine sediments were deposited on the accreted terrane in W. Oregon and Washington

- Subduction zone jumped westward. Sand and mud from rivers built offshore deltas, shoreline deposits and submarine fans.



USGS science for a changing world

3. Cascade arc volcanoes buried the eastern edge of the marine sediments and the accreted terrane.

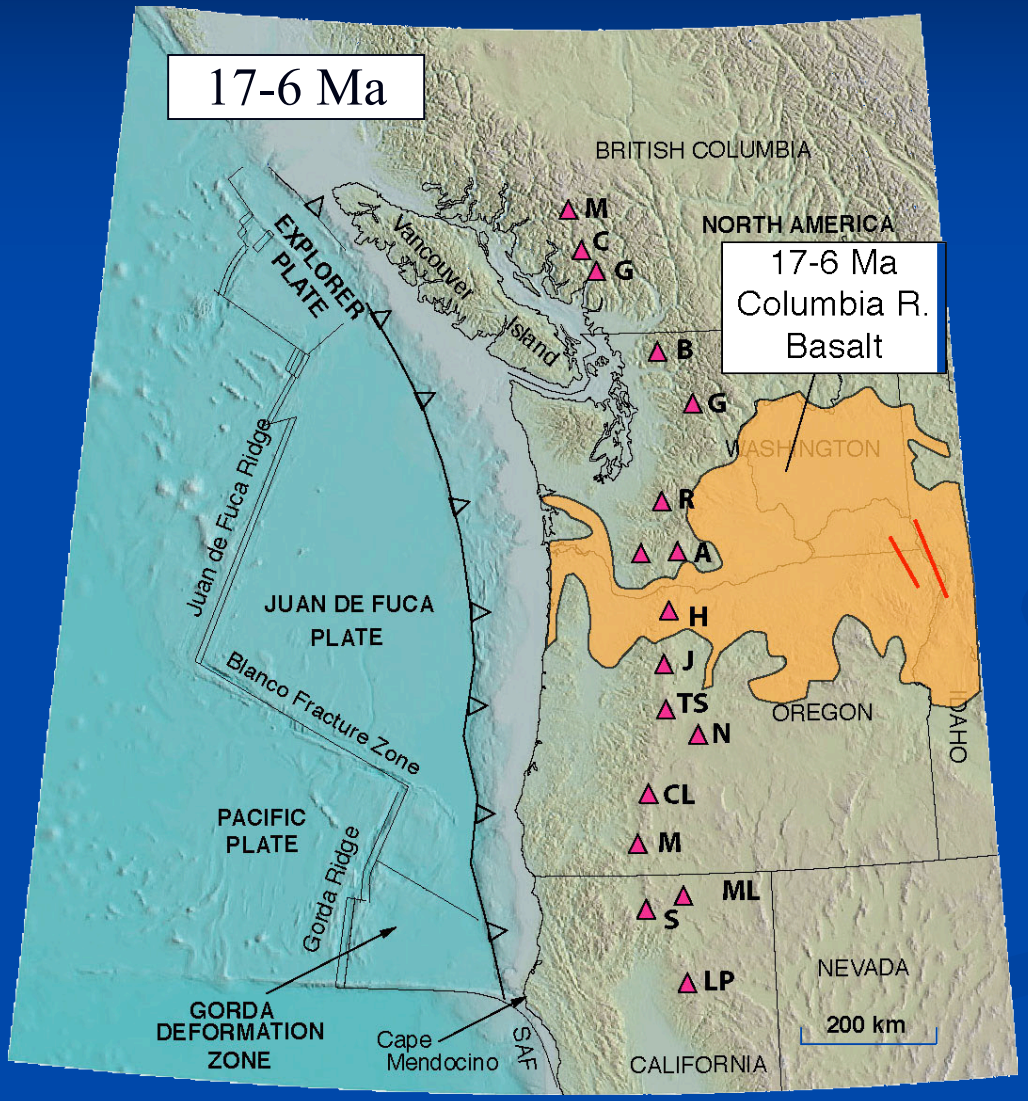


- Volcanic activity continues to the present.

Mount St. Helens Nov 05

USGS science for a changing world

4. Crustal stretching released a flood of basalt from fissures east of the arc



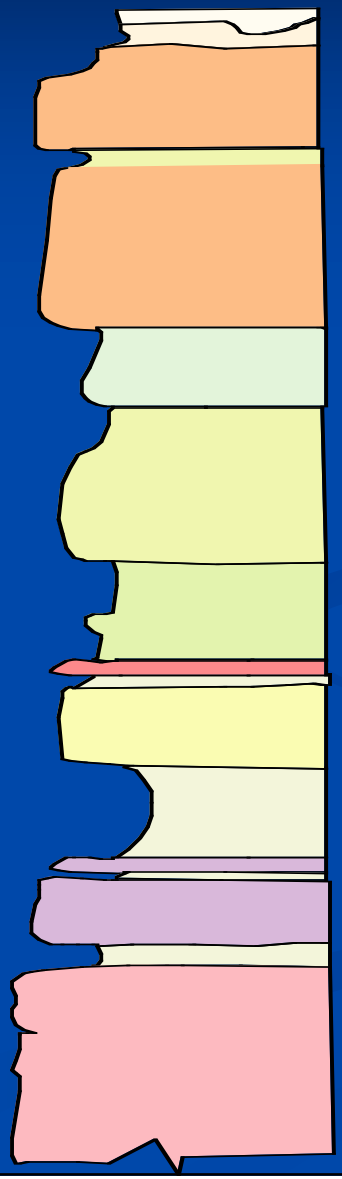
- Columbia River Basalt (CRB)
- 80% by volume erupted between 16.2 and 15.5 Ma
- Flowed 450 mi. into Pacific Ocean

CRB, Ginkgo State Park, WA.

USGS science for a changing world

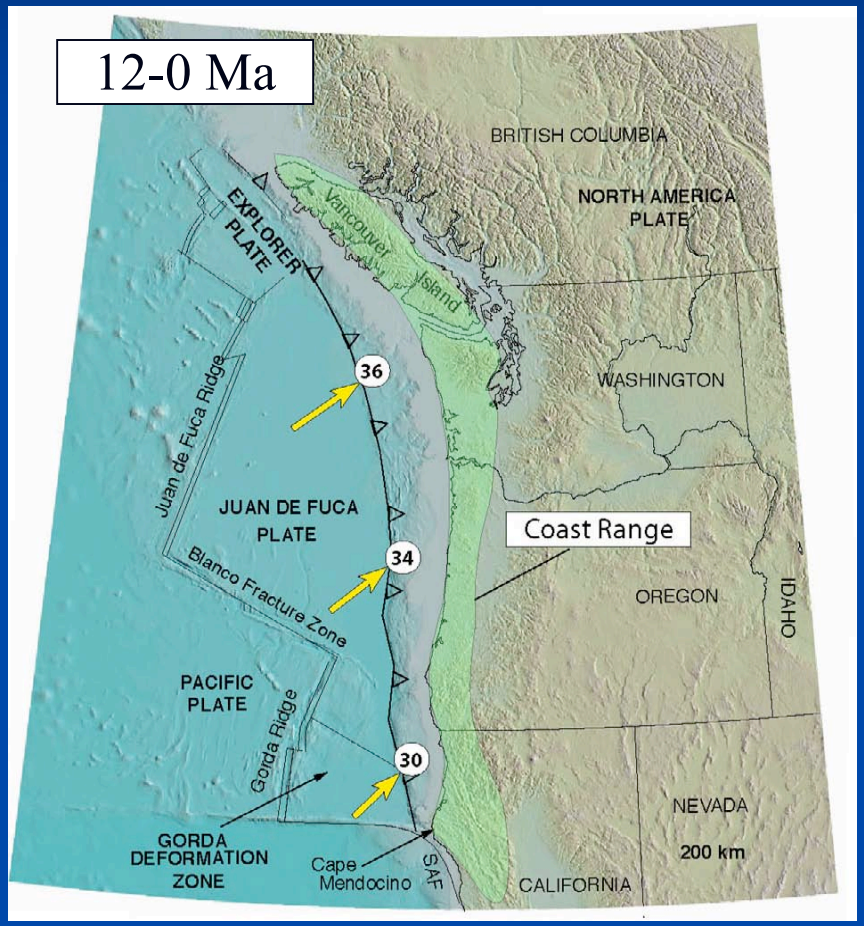
The resulting rock sequence in NW Oregon:

History	Age	Rock type
Modern rivers	15-0 Ka	Mud and sand Silt and sand
Glacial outburst floods (Missoula flood)	15 Ka	
Columbia R. Basalt	15 Ma	Basalt lava flows
Deposition of shallow-water marine sediments	40-20 Ma	Fine grained sandstone Sandstone
Deposition of deep marine sediments basalt intrusion	50-45 Ma	siltstone Basalt intrusions
Accretion of oceanic basalt terrane to N. America "Siletzia"	50 Ma	Basalt flows (submarine pillow basalt)

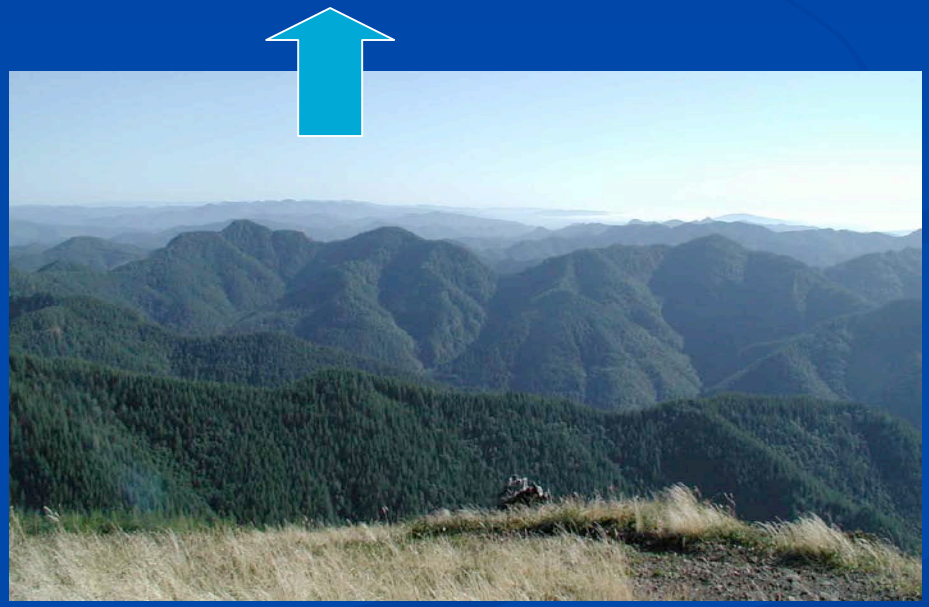


USGS science for a changing world

5a. An eastward "push" from Juan de Fuca plate causes uplift of the Coast Range.



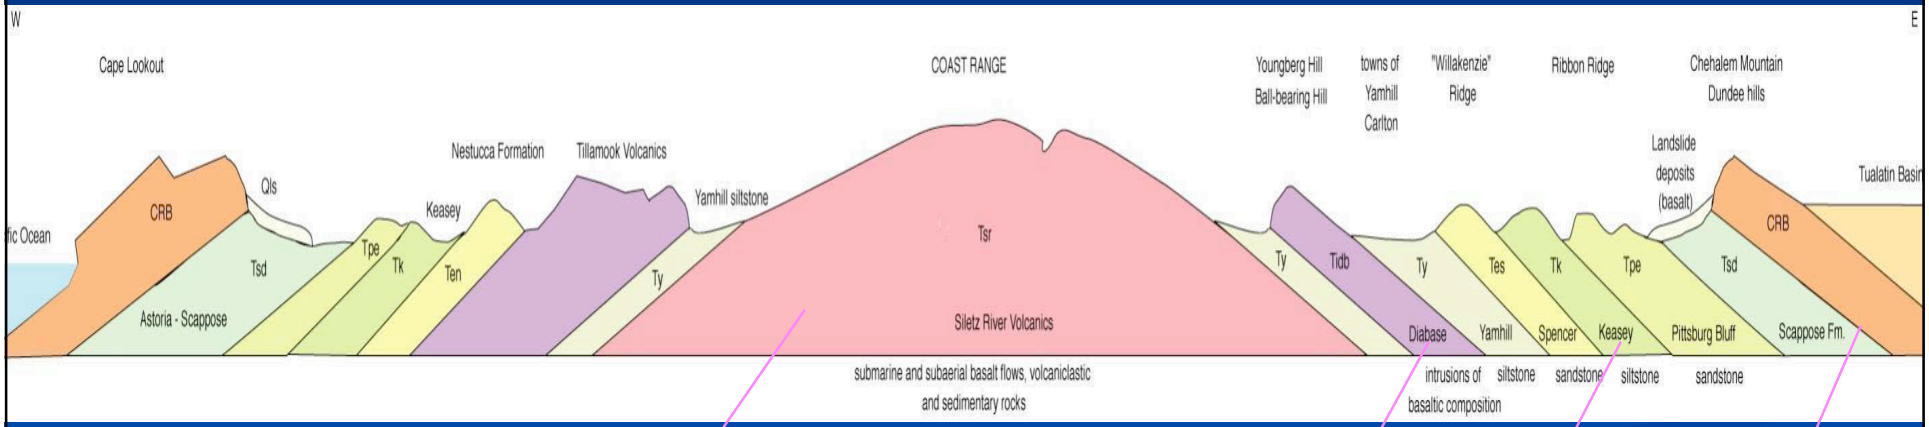
- Uplift



View S. toward Cape Lookout, OR.

USGS science for a changing world

5b. The strata in the uplifted Coast Range were folded into a broad arch, with the oldest rocks in the center.



50-million year-old Siletz River Volcanics

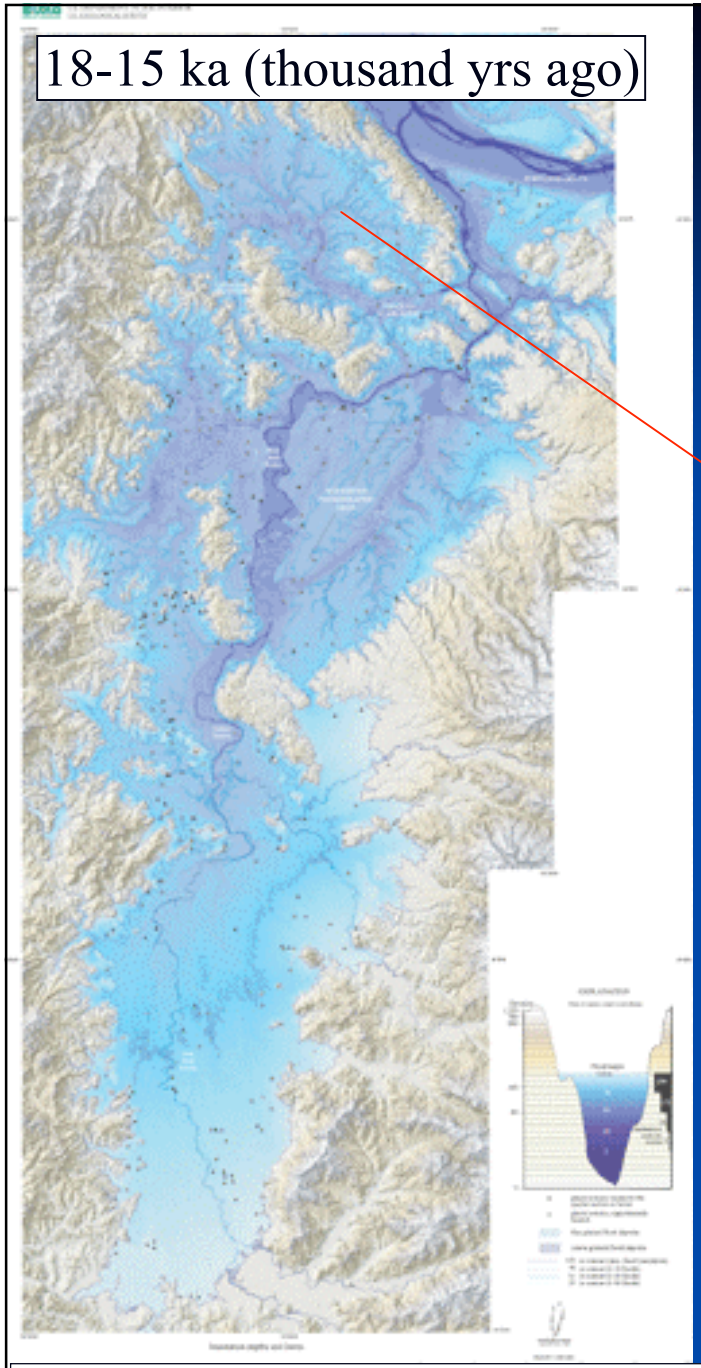
40-million year-old diabase (basalt) intrusions

30-million year-old marine sandstone and mudstone

15-million year-old Columbia River Basalt

USGS
science for a changing world

18-15 ka (thousand yrs ago)



http://geopubs.wr.usgs.gov/open-file/of03-408/

6. Catastrophic glacial outburst floods (at least 40) filled the Willamette Basin, leaving a blanket of silt on everything below ~ 400' elevation.

- 26 Rhythmically-bedded Missoula flood silts; Highway 26 at Cornell Rd.

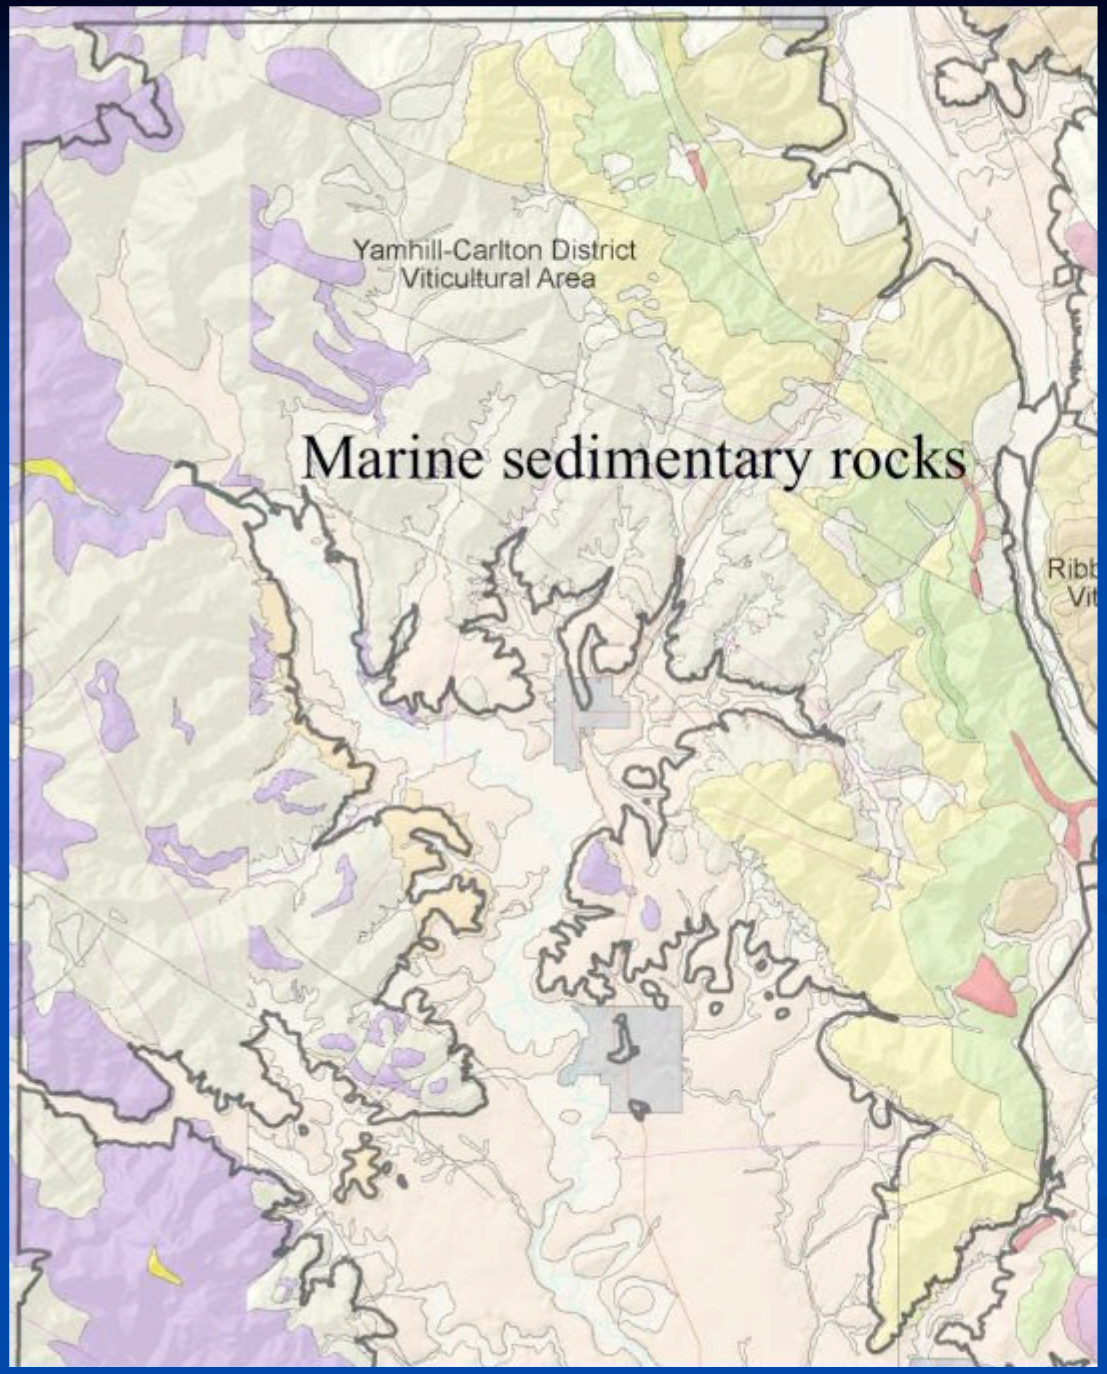
Idealized cross section

USGS science for a changing world



Yamhill-Carlton AVA

- Marine sedimentary rocks (yellow and green)
  - Spencer sandstone
  - Yamhill siltstone
  - Keasey Formation
  - Pittsburg Bluff Fm.
- Basalt intrusions (purple and red)

USGS
science for a changing world

Diabase (coarse-grained basalt intrusion) holds up many hills in Yamhill-Carlton-McMinnville area

USGS
science for a changing world

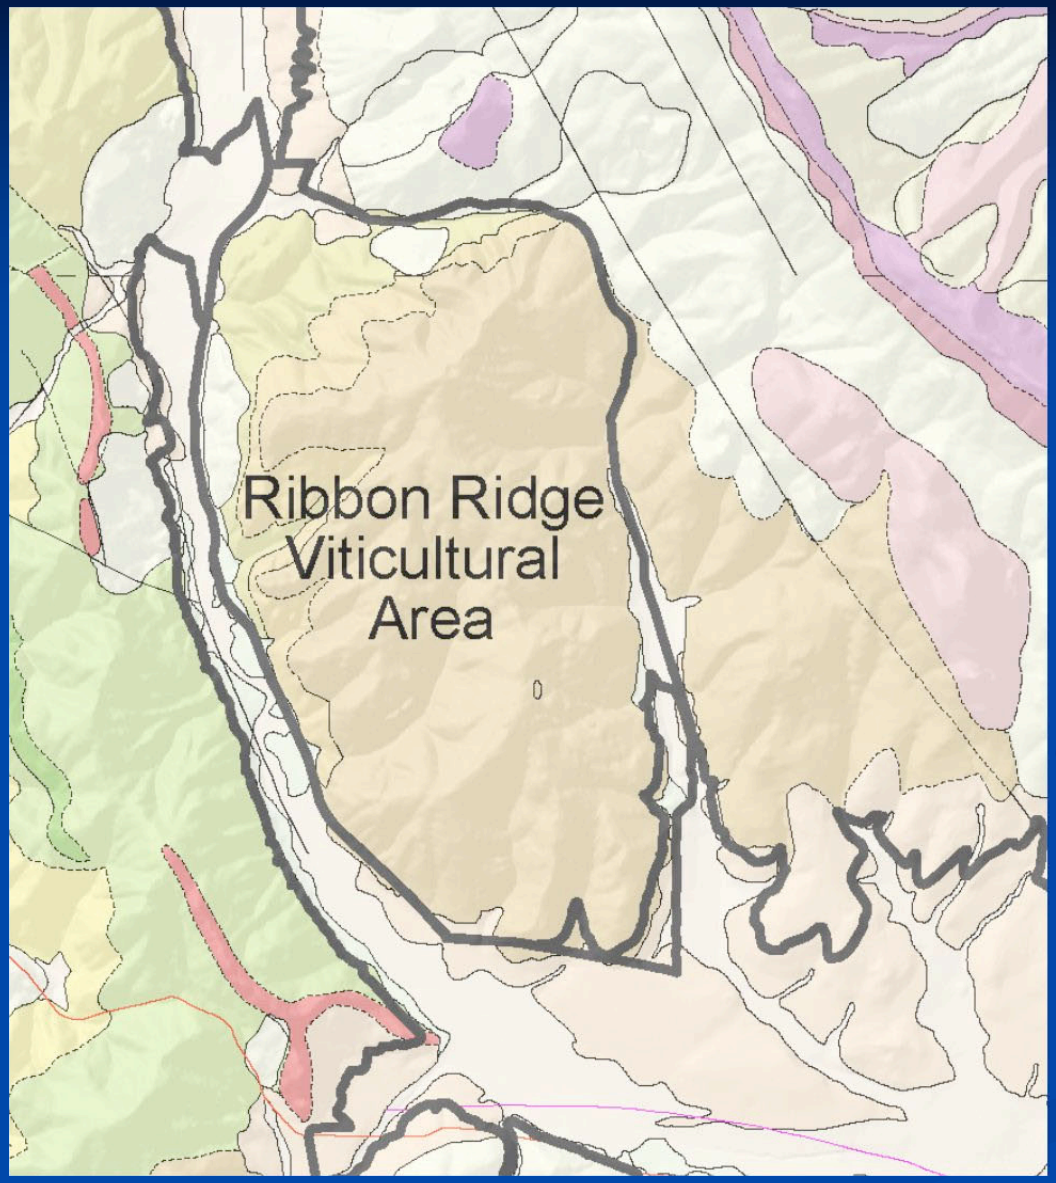
Yamhill-Carlton

- Spencer Formation sandstone
- Underlies "Willakenzie Ridge"

Well-exposed Spencer Formation sandstone at Hagg Lake

USGS science for a changing world

Ribbon Ridge AVA



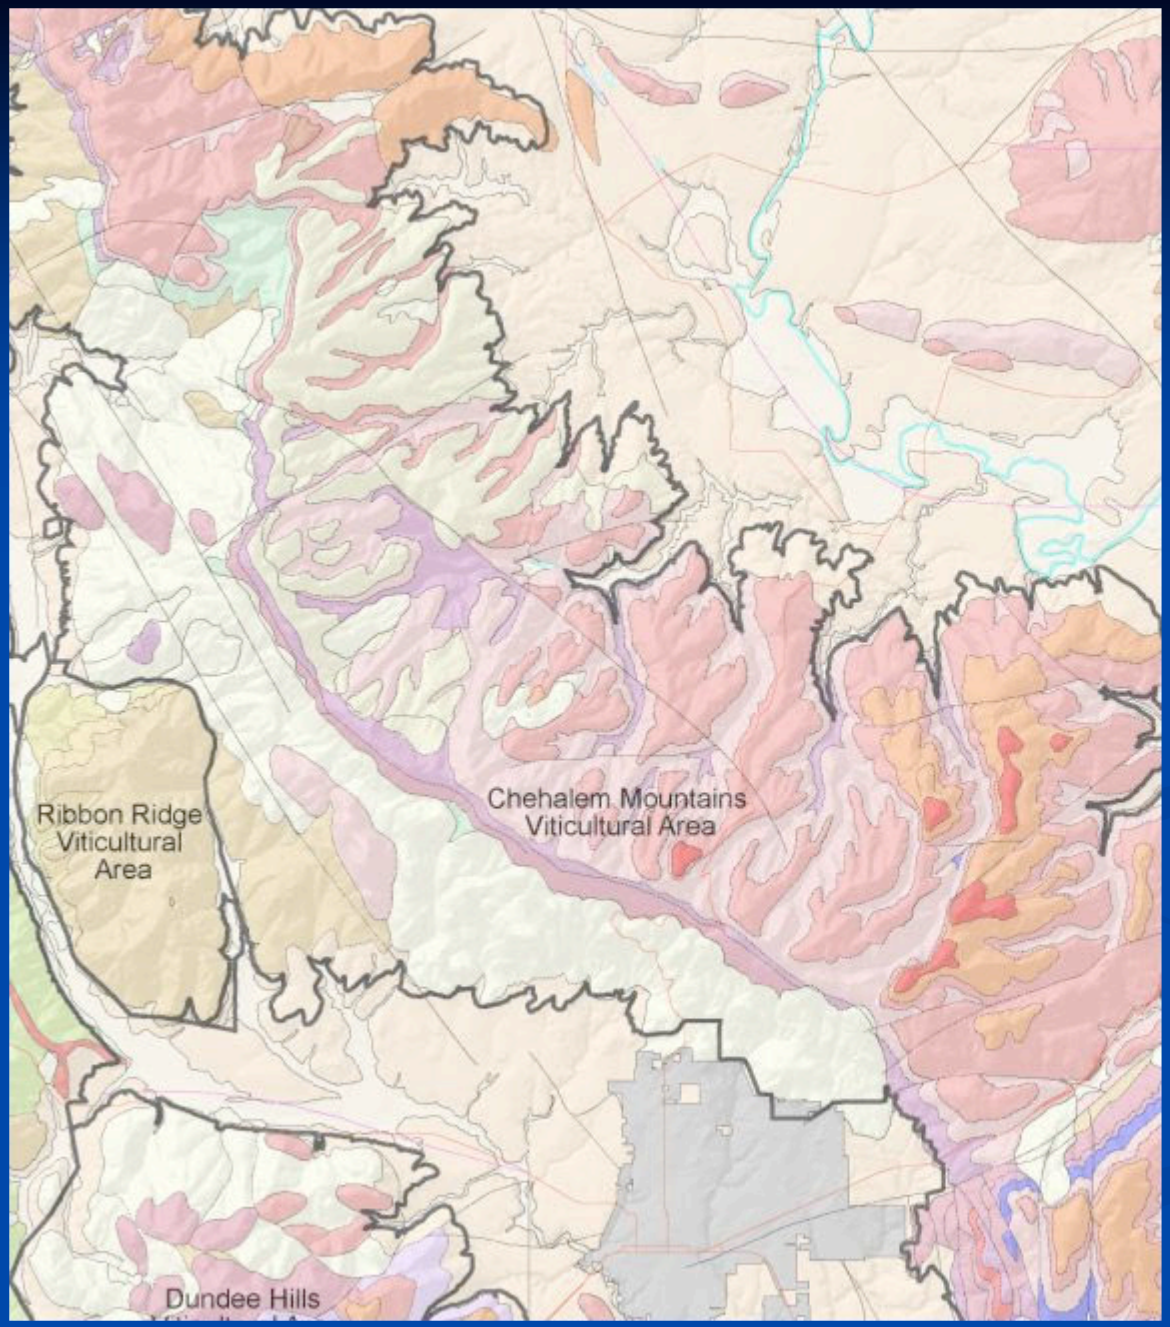
- Pittsburg Bluff Formation
  - Marine fine sandstone, siltstone, and mudstone
  - Volcanic tuff beds from Cascade arc

USGS
science for a changing world

Ribbon Ridge

- Loess (windblown silt)
- Paleosol (orange)
- Sandstone of Pittsburg Bluff

USGS
science for a changing world

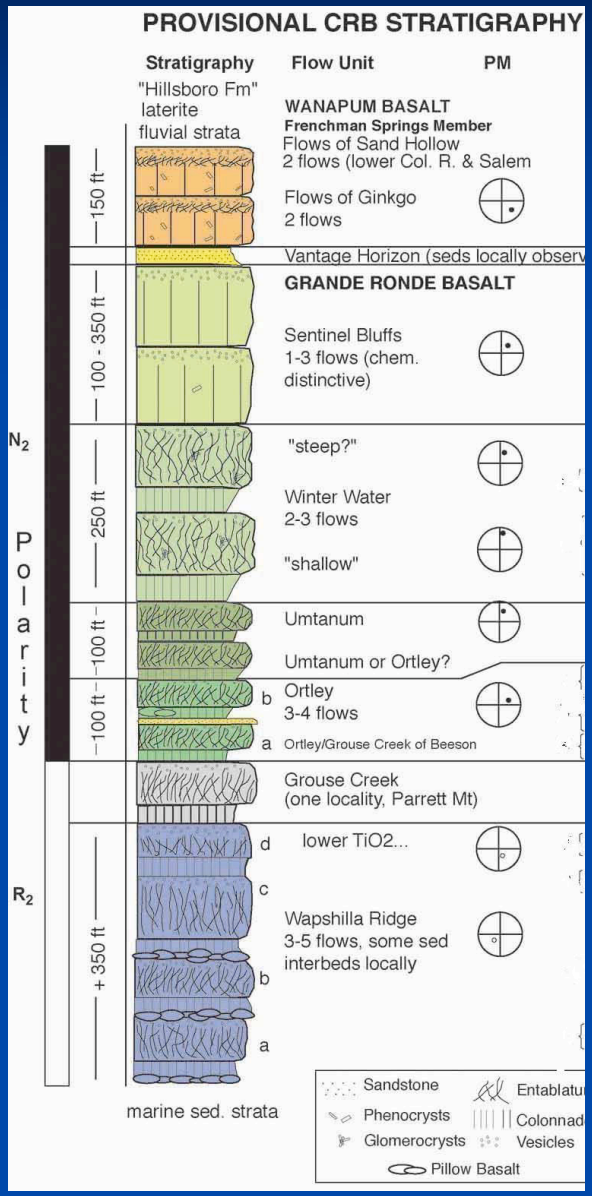


Chehalem Mountains AVA

- Columbia River Basalt
- Loess cap
- Slide bench of basalt on SW side
- Pittsburg Bluff marine sedimentary rock down low on west side.

USGS
science for a changing world

Flow by flow stratigraphy of the CRB

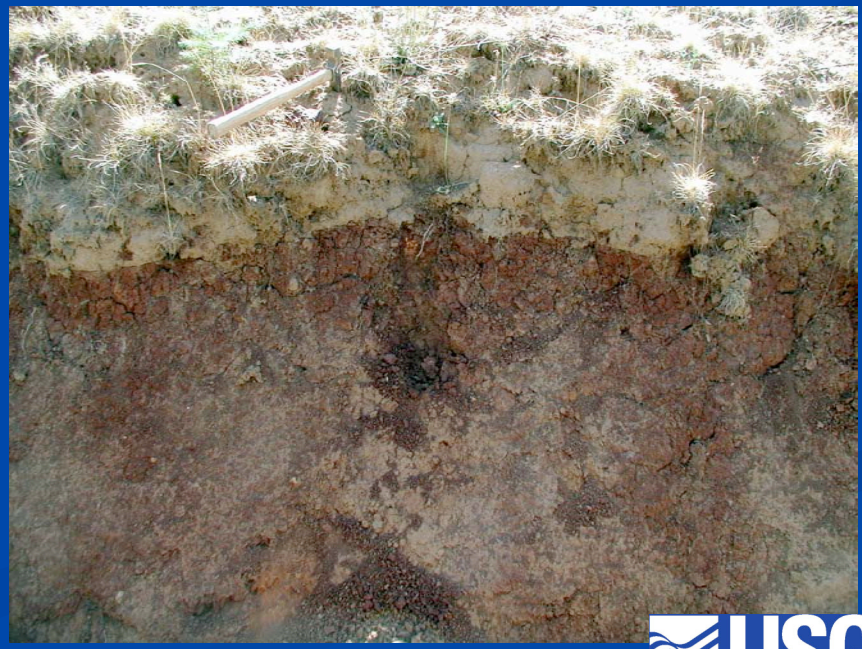


- Individual flows of CRB can be recognized with chemistry, physical appearance, and paleomagnetism.

USGS science for a changing world

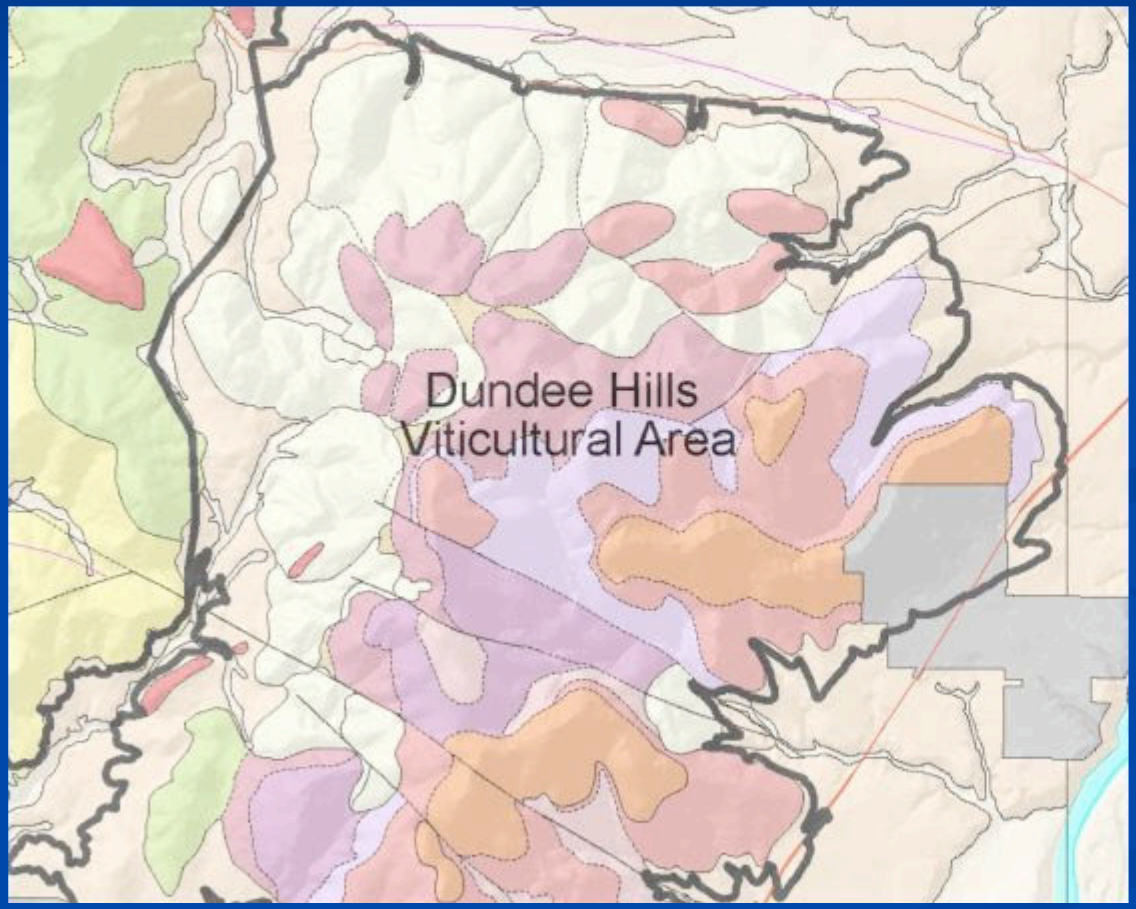
Chehalem Mountains

- Columbia River Basalt (CRB)
  - Sentinel Bluffs Mbr. of Grande Ronde Basalt
- Loess (wind-blown silt) over Jory-like paleosol on CRB



USGS
science for a changing world

Dundee Hills AVA



- Mostly Columbia River Basalt
  - Frenchman Springs Member
  - Grande Ronde-Sentinel Bluffs Mbr
  - Grande Ronde-Winter Water/Ortley/Wapshilla flows
  - Landslide bench on N and W

USGS
science for a changing world

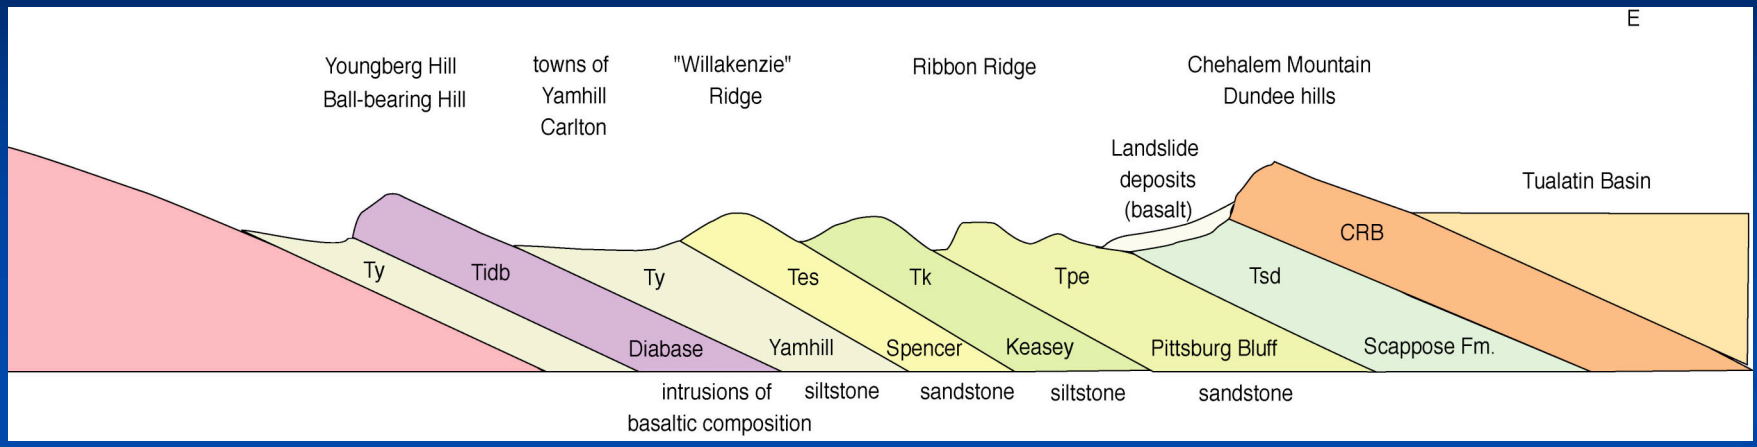
Dundee Hills

Maresh Vineyard

- Columbia River Basalt beneath Jory Soil
  - Grande Ronde Basalt in distance
  - Frenchman Spr. Mbr. Of Wanapum Basalt in upper part of vineyard

USGS
science for a changing world

What is the take away?



- From the Rogue to the Tualatin, each hillside has a story.
- Geology provides the landscape, its interaction with the sun and water, and the parent materials for the soils…
- And it holds up the vineyards!
